X-LINKED ADRENOLEUKODYSTROPHY

Morgan & Claypool. Paperback. Book Condition: New. Paperback. 132 pages. Dimensions: 9.2in. x 7.5in. x 0.3in. X-linked adrenoleukodystrophy (X-ALD) is the most common leukodystrophy and the most frequent peroxisomal disorder, with an estimated incidence of 1: 17, 000. This complex neurodegenerative disorder is characterized by a huge clinical variability both in the age of onset and in symptoms. The two main forms are the childhood cerebral ALD (ccALD) characterized by inflammatory demyelination of the central nervous system, and the adult form called adrenomyeloneuropathy (AMN), characterized by a non-inflammatory slowly progressive demyelination affecting spinal cord and peripheral nerves. Adrenal insufficiency is usually associated with the nervous symptoms, X-ALD being the main cause of Addison's disease. The main biochemical defect is the accumulation of very-long-chain fatty acids (VLCFA, fatty acids with a chain length of more than 22 carbon atoms), particularly in the cholesterol ester fraction of the adrenal gland and brain white matter. X-ALD is associated with mutations in the ABCD1 gene, which encodes for a peroxisomal ATP-binding Cassette (ABC) transporter predicted to allow VLCFA-CoA to enter into the peroxisome for their beta-oxidation. In spite of animal models, the pathogenesis of the disease remains poorly understood. However, several therapeutic strategies have been investigated. Among them, allogeneic bone marrow transplantation has proven effective and, more recently, the first gene therapy trial ended with a resounding success. Table of Contents: Historical Introduction Clinical Description Biochemistry The ABCD1 Gene: Cloning, Evolution, Expression, Mutations, Function Pathogenesis Diagnosis Therapeutic Strategies Acknowledgments References Internet Resources Author Biographies This item ships from multiple locations. Your book may arrive from Roseburg, OR, La Vergne, TN. Paperback.
